

PODIATRY INSTRUMENTS

Why should you buy from us?
Because we not only **SELL**
but also **MANUFACTURE**
our **SURGICAL INSTRUMENTS**

Returns / Warranty :

Stainless Steel Instruments

All **GerMedUSA** surgical instruments are guaranteed for life against manufacturing defects, provided that the instrument is used for its intended surgical purpose. **GerMedUSA** will either repair or replace the instrument without charge at our discretion*. Our liability under this guarantee shall be limited to repair or replacement of defective merchandise. Our guarantee is unqualified because our own quality control inspectors check **GerMedUSA** surgical instruments.

- * Our instruments are carefully examined by our surgical instrument experts.
- * No instrument is shipped unless it meets our standards.
- * Tungsten carbide instruments are included except for jaw inserts and Gold handles by a separate warranty.

GerMedUSA

GerMedUSA offers the finest Quality Instruments at the most affordable prices, available for immediate delivery anywhere in the world. Quality begins at GerMedUSA where master craftsmen forge and manufacture each precision tool to GerMedUSA's exact specifications and measurements. The instruments must undergo a series of quality control specifications in order to be worthy of the GerMedUSA name and warranty.

Podiatry instruments are used to help diagnose and treat conditions affecting the ankle, foot and related structures of the leg. Within the field of podiatry, practitioners can focus on many different specialty areas, including surgery, biomechanics, geriatrics, sports medicine, pediatrics, primary care or orthopedics. Podiatric surgery is designed to ensure functionality of the ankle and foot areas.

Some of the top Procedures performed in Podiatry Surgery are:

Fasciotomy is a surgical procedure that cuts away the fascia and relieves tension or pressure.

Description:

Fasciotomy in the limbs is usually performed by a surgeon under general anesthesia. An incision is made in the skin, and a small area of fascia is removed. The incision is then closed.

Diagnosis:

Fasciotomy is performed on an emergency basis, and the outcome of the surgery depends largely on the general health of the person.

Bunionectomy A bunionectomy is a surgical procedure to remove, or excise, a bunion. A bunion is an enlargement of the joint at the base of the big toe. It is normally comprised of bone and soft tissue.

Description:

Bunions become more common usually later in life. One reason is that with age the foot spreads and proper alignment is not maintained.

Diagnosis

The physical exam should include an assessment while standing and walking to judge the degree to which stability and gait have been affected. Assessment while seated or lying down to measure range of motion and anatomical integrity. An examination of the foot itself will check for the presence of unusual calluses, which help indicate abnormal patterns of friction. Circulation in the affected foot will be noted by checking the skin color and temperature. Neurological assessment is also conducted.

Tenotomy is the cutting of a tendon. Related procedures are also called tendon release, tendon lengthening, and heel-cord release.

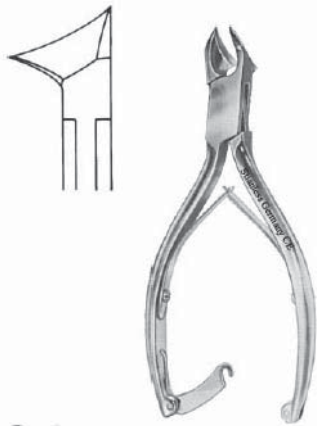

Description

During a tenotomy, the tendon is cut partway through or entirely, this allows the muscle to be stretched. Tenotomy may be performed through the skin or by surgically exposing the tendon. The details of the operation differ for each tendon.

Diagnosis

Tests performed before surgery include determining the range of motion of the joint involved, and possibly x-rays to determine if there is a bone deformity impeding movement or subluxation.
